

COMBINED SCIENCE GCSE CHEMISTRY PAPER 2 FOUNDATON

MAJOR FOCUS

NOT MENTIONED

NOT ASSESSED

5.6 The rate and extent of chemical change

Chemical reactions can occur at vastly different rates. Whilst the reactivity of chemicals is a significant factor in how fast chemical reactions proceed, there are many variables that can be manipulated in order to speed them up or slow them down. Chemical reactions may also be reversible and therefore the effect of different variables needs to be established in order to identify how to maximise the yield of desired product. Understanding energy changes that accompany chemical reactions is important for this process. In industry, chemists and chemical engineers determine the effect of different variables on reaction rate and yield of product. Whilst there may be compromises to be made, they carry out optimisation processes to ensure that enough product is produced within a sufficient time, and in an energy-efficient way.

5.6.1 Rate of reaction

5.6.1.1 Calculating rates of reactions

Content	Key opportunities for skills development
<p>The rate of a chemical reaction can be found by measuring the quantity of a reactant used or the quantity of product formed over time:</p>	MS 1a
$\text{mean rate of reaction} = \frac{\text{quantity of reactant used}}{\text{time taken}}$	Recognise and use expressions in decimal form.
$\text{mean rate of reaction} = \frac{\text{quantity of product formed}}{\text{time taken}}$	MS 1c
<p>The quantity of reactant or product can be measured by the mass in grams or by a volume in cm³.</p>	Use ratios, fractions and percentages.
<p>The units of rate of reaction may be given as g/s or cm³/s.</p>	MS 1d
<p>For the Higher Tier, students are also required to use quantity of reactants in terms of moles and units for rate of reaction in mol/s.</p>	Make estimates of the results of simple calculations.
<p>Students should be able to:</p>	MS 4a
<ul style="list-style-type: none">calculate the mean rate of a reaction from given information about the quantity of a reactant used or the quantity of a product formed and the time taken	Translate information between graphical and numeric form.
<ul style="list-style-type: none">draw, and interpret, graphs showing the quantity of product formed or quantity of reactant used up against time	MS 4b
<ul style="list-style-type: none">draw tangents to the curves on these graphs and use the slope of the tangent as a measure of the rate of reaction	Drawing and interpreting appropriate graphs from data to determine rate of reaction.
<ul style="list-style-type: none">(HT only) calculate the gradient of a tangent to the curve on these graphs as a measure of rate of reaction at a specific time.	MS 4c
	Plot two variables from experimental or other data.
	MS 4d
	Determine the slope and intercept of a linear graph.
	MS 4e
	Draw and use the slope of a tangent to a curve as a measure of rate of change.

5.6.1.2 Factors which affect the rates of chemical reactions

Content	Key opportunities for skills development
Factors which affect the rates of chemical reactions include: the concentrations of reactants in solution, the pressure of reacting gases, the surface area of solid reactants, the temperature and the presence of catalysts.	
Students should be able to recall how changing these factors affects the rate of chemical reactions.	This topic offers opportunities for practical work and investigations in addition to required practical 11.

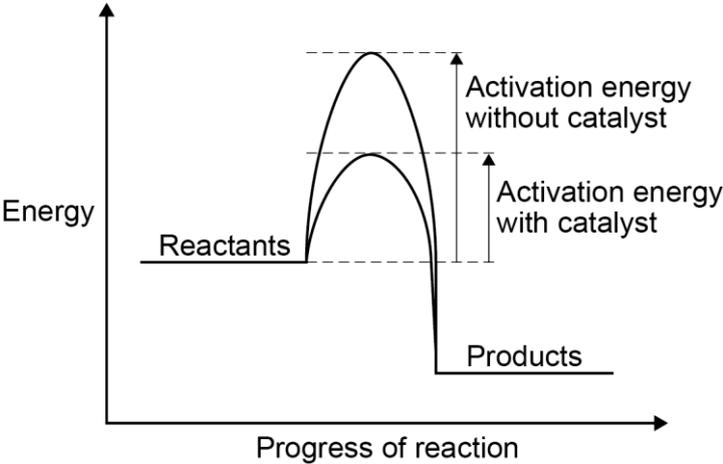

Required practical activity 11: investigate how changes in concentration affect the rates of reactions by a method involving measuring the volume of a gas produced and a method involving a change in colour or turbidity.

5.6.1.3 Collision theory and activation energy

Content	Key opportunities for skills development
Collision theory explains how various factors affect rates of reactions. According to this theory, chemical reactions can occur only when reacting particles collide with each other and with sufficient energy. The minimum amount of energy that particles must have to react is called the activation energy. Increasing the concentration of reactants in solution, the pressure of reacting gases, and the surface area of solid reactants increases the frequency of collisions and so increases the rate of reaction. Increasing the temperature increases the frequency of collisions and makes the collisions more energetic, and so increases the rate of reaction.	
Students should be able to : <ul style="list-style-type: none">predict and explain using collision theory the effects of changing conditions of concentration, pressure and temperature on the rate of a reaction	WS 1.2

Content	Key opportunities for skills development
<ul style="list-style-type: none"> predict and explain the effects of changes in the size of pieces of a reacting solid in terms of surface area to volume ratio use simple ideas about proportionality when using collision theory to explain the effect of a factor on the rate of a reaction. 	MS 5c MS 1c

5.6.1.4 Catalysts

Content	Key opportunities for skills development
<p>Catalysts change the rate of chemical reactions but are not used up during the reaction. Different reactions need different catalysts. Enzymes act as catalysts in biological systems.</p> <p>Catalysts increase the rate of reaction by providing a different pathway for the reaction that has a lower activation energy.</p> <p>A reaction profile for a catalysed reaction can be drawn in the following form:</p>  <p>Students should be able to identify catalysts in reactions from their effect on the rate of reaction and because they are not included in the chemical equation for the reaction.</p> <p>Students should be able to explain catalytic action in terms of activation energy.</p> <p>Students do not need to know the names of catalysts other than those specified in the subject content.</p>	AT 5 An opportunity to investigate the catalytic effect of adding different metal salts to a reaction such as the decomposition of hydrogen peroxide.

5.6.2 Reversible reactions and dynamic equilibrium

5.6.2.1 Reversible reactions

Content	Key opportunities for skills development
<p>In some chemical reactions, the products of the reaction can react to produce the original reactants. Such reactions are called reversible reactions and are represented:</p> $A + B \rightleftharpoons C + D$ <p>The direction of reversible reactions can be changed by changing the conditions.</p> <p>For example:</p> <p>ammonium chloride $\xrightleftharpoons[\text{cool}]{\text{heat}}$ ammonia + hydrogen chloride</p>	

5.6.2.2 Energy changes and reversible reactions

Content	Key opportunities for skills development
<p>If a reversible reaction is exothermic in one direction, it is endothermic in the opposite direction. The same amount of energy is transferred in each case. For example:</p> <p>hydrated copper sulfate (blue) $\xrightleftharpoons[\text{exothermic}]{\text{endothermic}}$ anhydrous copper sulfate (white) + water</p>	

5.6.2.3 Equilibrium

Content	Key opportunities for skills development
<p>When a reversible reaction occurs in apparatus which prevents the escape of reactants and products, equilibrium is reached when the forward and reverse reactions occur at exactly the same rate.</p>	WS 1.2

5.7 Organic chemistry

The chemistry of carbon compounds is so important that it forms a separate branch of chemistry. A great variety of carbon compounds is possible because carbon atoms can form chains and rings linked by C-C bonds. This branch of chemistry gets its name from the fact that the main sources of organic compounds are living, or once-living materials from plants and animals. These sources include fossil fuels which are a major source of feedstock for the petrochemical industry. Chemists are able to take organic molecules and modify them in many ways to make new and useful materials such as polymers, pharmaceuticals, perfumes and flavourings, dyes and detergents.

5.7.1 Carbon compounds as fuels and feedstock

5.7.1.1 Crude oil, hydrocarbons and alkanes

Content	Key opportunities for skills development
<p>Crude oil is a finite resource found in rocks. Crude oil is the remains of an ancient biomass consisting mainly of plankton that was buried in mud.</p> <p>Crude oil is a mixture of a very large number of compounds. Most of the compounds in crude oil are hydrocarbons, which are molecules made up of hydrogen and carbon atoms only.</p> <p>Most of the hydrocarbons in crude oil are hydrocarbons called alkanes. The general formula for the homologous series of alkanes is C_nH_{2n+2}</p> <p>The first four members of the alkanes are methane, ethane, propane and butane.</p> <p>Alkane molecules can be represented in the following forms:</p> <p>C_2H_6 or</p> $\begin{array}{c} \text{H} \quad \text{H} \\ \quad \\ \text{H}-\text{C}-\text{C}-\text{H} \\ \quad \\ \text{H} \quad \text{H} \end{array}$ <p>Students should be able to recognise substances as alkanes given their formulae in these forms.</p> <p>Students do not need to know the names of specific alkanes other than methane, ethane, propane and butane.</p>	<p>WS 1.2</p> <p>Make models of alkane molecules using the molecular modelling kits.</p>

5.7.1.2 Fractional distillation and petrochemicals

Content	Key opportunities for skills development
<p>The many hydrocarbons in crude oil may be separated into fractions, each of which contains molecules with a similar number of carbon atoms, by fractional distillation.</p> <p>The fractions can be processed to produce fuels and feedstock for the petrochemical industry.</p> <p>Many of the fuels on which we depend for our modern lifestyle, such as petrol, diesel oil, kerosene, heavy fuel oil and liquefied petroleum gases, are produced from crude oil.</p> <p>Many useful materials on which modern life depends are produced by the petrochemical industry, such as solvents, lubricants, polymers, detergents.</p> <p>The vast array of natural and synthetic carbon compounds occur due to the ability of carbon atoms to form families of similar compounds.</p> <p>Students should be able to explain how fractional distillation works in terms of evaporation and condensation.</p> <p>Knowledge of the names of other specific fractions or fuels is not required.</p>	WS 1.2

5.7.1.3 Properties of hydrocarbons

Content	Key opportunities for skills development
<p>Some properties of hydrocarbons depend on the size of their molecules, including boiling point, viscosity and flammability. These properties influence how hydrocarbons are used as fuels.</p> <p>Students should be able to recall how boiling point, viscosity and flammability change with increasing molecular size.</p> <p>The combustion of hydrocarbon fuels releases energy. During combustion, the carbon and hydrogen in the fuels are oxidised. The complete combustion of a hydrocarbon produces carbon dioxide and water.</p> <p>Students should be able to write balanced equations for the complete combustion of hydrocarbons with a given formula.</p> <p>Knowledge of trends in properties of hydrocarbons is limited to:</p> <ul style="list-style-type: none">• boiling points• viscosity• flammability.	WS 1.2, 4.1 Investigate the properties of different hydrocarbons.

5.7.1.4 Cracking and alkenes

Content	Key opportunities for skills development
<p>Hydrocarbons can be broken down (cracked) to produce smaller, more useful molecules.</p> <p>Cracking can be done by various methods including catalytic cracking and steam cracking.</p> <p>Students should be able to describe in general terms the conditions used for catalytic cracking and steam cracking.</p> <p>The products of cracking include alkanes and another type of hydrocarbon called alkenes.</p> <p>Alkenes are more reactive than alkanes and react with bromine water, which is used as a test for alkenes.</p> <p>Students should be able to recall the colour change when bromine water reacts with an alkene.</p> <p>There is a high demand for fuels with small molecules and so some of the products of cracking are useful as fuels.</p> <p>Alkenes are used to produce polymers and as starting materials for the production of many other chemicals.</p> <p>Students should be able to balance chemical equations as examples of cracking given the formulae of the reactants and products.</p> <p>Students should be able to give examples to illustrate the usefulness of cracking. They should also be able to explain how modern life depends on the uses of hydrocarbons.</p> <p>(Students do not need to know the formulae or names of individual alkenes.)</p>	WS 1.2

5.8 Chemical analysis

Analysts have developed a range of qualitative tests to detect specific chemicals. The tests are based on reactions that produce a gas with distinctive properties, or a colour change or an insoluble solid that appears as a precipitate.

Instrumental methods provide fast, sensitive and accurate means of analysing chemicals, and are particularly useful when the amount of chemical being analysed is small. Forensic scientists and drug control scientists rely on such instrumental methods in their work.

5.8.1 Purity, formulations and chromatography

5.8.1.1 Pure substances

Content	Key opportunities for skills development
<p>In chemistry, a pure substance is a single element or compound, not mixed with any other substance.</p> <p>Pure elements and compounds melt and boil at specific temperatures. Melting point and boiling point data can be used to distinguish pure substances from mixtures.</p> <p>In everyday language, a pure substance can mean a substance that has had nothing added to it, so it is unadulterated and in its natural state, eg pure milk.</p> <p>Students should be able to use melting point and boiling point data to distinguish pure from impure substances.</p>	WS 2.2, 4.1

5.8.1.2 Formulations

Content	Key opportunities for skills development
<p>A formulation is a mixture that has been designed as a useful product. Many products are complex mixtures in which each chemical has a particular purpose. Formulations are made by mixing the components in carefully measured quantities to ensure that the product has the required properties. Formulations include fuels, cleaning agents, paints, medicines, alloys, fertilisers and foods.</p> <p>Students should be able to identify formulations given appropriate information.</p> <p>Students do not need to know the names of components in proprietary products.</p>	WS 1.4, 2.2

5.8.1.3 Chromatography

Content	Key opportunities for skills development
<p>Chromatography can be used to separate mixtures and can give information to help identify substances. Chromatography involves a stationary phase and a mobile phase. Separation depends on the distribution of substances between the phases.</p> <p>The ratio of the distance moved by a compound (centre of spot from origin) to the distance moved by the solvent can be expressed as its R_f value:</p> $R_f = \frac{\text{distance moved by substance}}{\text{distance moved by solvent}}$ <p>Different compounds have different R_f values in different solvents, which can be used to help identify the compounds. The compounds in a mixture may separate into different spots depending on the solvent but a pure compound will produce a single spot in all solvents.</p> <p>Students should be able to:</p> <ul style="list-style-type: none">• explain how paper chromatography separates mixtures• suggest how chromatographic methods can be used for distinguishing pure substances from impure substances• interpret chromatograms and determine R_f values from chromatograms	<p>WS 2.2, 3.1, 2, 3</p> <p>MS 1a</p> <p>Recognise and use expressions in decimal form.</p> <p>MS 1c</p> <p>Use ratios, fractions and percentages.</p> <p>MS 1d</p> <p>Make estimates of the results of simple calculations.</p>
<ul style="list-style-type: none">• provide answers to an appropriate number of significant figures.	<p>MS 2a</p>

Required practical activity 12: investigate how paper chromatography can be used to separate and tell the difference between coloured substances. Students should calculate R_f values.

5.8.2 Identification of common gases

5.8.2.1 Test for hydrogen

Content	Key opportunities for skills development
<p>The test for hydrogen uses a burning splint held at the open end of a test tube of the gas. Hydrogen burns rapidly with a pop sound.</p>	

5.8.2.2 Test for oxygen

Content	Key opportunities for skills development
The test for oxygen uses a glowing splint inserted into a test tube of the gas. The splint relights in oxygen.	

5.8.2.3 Test for carbon dioxide

Content	Key opportunities for skills development
The test for carbon dioxide uses an aqueous solution of calcium hydroxide (lime water). When carbon dioxide is shaken with or bubbled through limewater the limewater turns milky (cloudy).	

5.8.2.4 Test for chlorine

Content	Key opportunities for skills development
The test for chlorine uses litmus paper. When damp litmus paper is put into chlorine gas the litmus paper is bleached and turns white.	

5.9 Chemistry of the atmosphere

The Earth's atmosphere is dynamic and forever changing. The causes of these changes are sometimes man-made and sometimes part of many natural cycles. Scientists use very complex software to predict weather and climate change as there are many variables that can influence this. The problems caused by increased levels of air pollutants require scientists and engineers to develop solutions that help to reduce the impact of human activity.

5.9.1 The composition and evolution of the Earth's atmosphere

5.9.1.1 The proportions of different gases in the atmosphere

Content	Key opportunities for skills development
<p>For 200 million years, the proportions of different gases in the atmosphere have been much the same as they are today:</p> <ul style="list-style-type: none">• about four-fifths (approximately 80%) nitrogen• about one-fifth (approximately 20%) oxygen• small proportions of various other gases, including carbon dioxide, water vapour and noble gases.	<p>MS 1c</p> <p>To use ratios, fractions and percentages.</p>

5.9.1.2 The Earth's early atmosphere

Content	Key opportunities for skills development
<p>Theories about what was in the Earth's early atmosphere and how the atmosphere was formed have changed and developed over time. Evidence for the early atmosphere is limited because of the time scale of 4.6 billion years.</p> <p>One theory suggests that during the first billion years of the Earth's existence there was intense volcanic activity that released gases that formed the early atmosphere and water vapour that condensed to form the oceans. At the start of this period the Earth's atmosphere may have been like the atmospheres of Mars and Venus today, consisting of mainly carbon dioxide with little or no oxygen gas.</p> <p>Volcanoes also produced nitrogen which gradually built up in the atmosphere and there may have been small proportions of methane and ammonia.</p> <p>When the oceans formed carbon dioxide dissolved in the water and carbonates were precipitated producing sediments, reducing the amount of carbon dioxide in the atmosphere. No knowledge of other theories is required.</p> <p>Students should be able to, given appropriate information, interpret evidence and evaluate different theories about the Earth's early atmosphere.</p>	WS 1.1, 1.2, 1.3, 3.5, 3.6, 4.1

5.9.1.3 How oxygen increased

Content	Key opportunities for skills development
<p>Algae and plants produced the oxygen that is now in the atmosphere by photosynthesis, which can be represented by the equation:</p> $6\text{CO}_2 + 6\text{H}_2\text{O} \xrightarrow{\text{light}} \text{C}_6\text{H}_{12}\text{O}_6 + 6\text{O}_2$ <p>carbon dioxide + water → glucose + oxygen</p> <p>Algae first produced oxygen about 2.7 billion years ago and soon after this oxygen appeared in the atmosphere. Over the next billion years plants evolved and the percentage of oxygen gradually increased to a level that enabled animals to evolve.</p>	WS 1.2 An opportunity to show that aquatic plants produce oxygen in daylight.

5.9.1.4 How carbon dioxide decreased

Content	Key opportunities for skills development
<p>Algae and plants decreased the percentage of carbon dioxide in the atmosphere by photosynthesis.</p> <p>Carbon dioxide was also decreased by the formation of sedimentary rocks and fossil fuels that contain carbon.</p>	
<p>Students should be able to:</p> <ul style="list-style-type: none">• describe the main changes in the atmosphere over time and some of the likely causes of these changes• describe and explain the formation of deposits of limestone, coal, crude oil and natural gas.	WS 1.2, 4.1

5.9.2 Carbon dioxide and methane as greenhouse gases

5.9.2.1 Greenhouse gases

Content	Key opportunities for skills development
<p>Greenhouse gases in the atmosphere maintain temperatures on Earth high enough to support life. Water vapour, carbon dioxide and methane are greenhouse gases.</p> <p>Students should be able to describe the greenhouse effect in terms of the interaction of short and long wavelength radiation with matter.</p>	WS 1.2

5.9.2.2 Human activities which contribute to an increase in greenhouse gases in the atmosphere

Content	Key opportunities for skills development
<p>Some human activities increase the amounts of greenhouse gases in the atmosphere. These include:</p> <ul style="list-style-type: none">• carbon dioxide• methane. <p>Students should be able to recall two human activities that increase the amounts of each of the greenhouse gases carbon dioxide and methane.</p> <p>Based on peer-reviewed evidence, many scientists believe that human activities will cause the temperature of the Earth's atmosphere to increase at the surface and that this will result in global climate change.</p> <p>However, it is difficult to model such complex systems as global climate change. This leads to simplified models, speculation and opinions presented in the media that may be based on only parts of the evidence and which may be biased.</p>	
<p>Students should be able to:</p> <ul style="list-style-type: none">• evaluate the quality of evidence in a report about global climate change given appropriate information• describe uncertainties in the evidence base• recognise the importance of peer review of results and of communicating results to a wide range of audiences.	WS 1.2, 1.3, 1.6

5.9.2.3 Global climate change

Content	Key opportunities for skills development
<p>An increase in average global temperature is a major cause of climate change.</p> <p>There are several potential effects of global climate change.</p> <p>Students should be able to:</p> <ul style="list-style-type: none">• describe briefly four potential effects of global climate change• discuss the scale, risk and environmental implications of global climate change.	WS 1.5

5.9.2.4 The carbon footprint and its reduction

Content	Key opportunities for skills development
<p>The carbon footprint is the total amount of carbon dioxide and other greenhouse gases emitted over the full life cycle of a product, service or event.</p> <p>The carbon footprint can be reduced by reducing emissions of carbon dioxide and methane.</p> <p>Students should be able to:</p> <ul style="list-style-type: none">• describe actions to reduce emissions of carbon dioxide and methane• give reasons why actions may be limited.	WS 1.3

5.9.3 Common atmospheric pollutants and their sources

5.9.3.1 Atmospheric pollutants from fuels

Content	Key opportunities for skills development
<p>The combustion of fuels is a major source of atmospheric pollutants.</p> <p>Most fuels, including coal, contain carbon and/or hydrogen and may also contain some sulfur.</p> <p>The gases released into the atmosphere when a fuel is burned may include carbon dioxide, water vapour, carbon monoxide, sulfur dioxide and oxides of nitrogen. Solid particles and unburned hydrocarbons may also be released that form particulates in the atmosphere.</p> <p>Students should be able to:</p> <ul style="list-style-type: none">• describe how carbon monoxide, soot (carbon particles), sulfur dioxide and oxides of nitrogen are produced by burning fuels	
<ul style="list-style-type: none">• predict the products of combustion of a fuel given appropriate information about the composition of the fuel and the conditions in which it is used.	WS 1.2

5.9.3.2 Properties and effects of atmospheric pollutants

Content	Key opportunities for skills development
<p>Carbon monoxide is a toxic gas. It is colourless and odourless and so is not easily detected.</p> <p>Sulfur dioxide and oxides of nitrogen cause respiratory problems in humans and cause acid rain.</p> <p>Particulates cause global dimming and health problems for humans.</p>	
<p>Students should be able to describe and explain the problems caused by increased amounts of these pollutants in the air.</p>	WS 1.4

5.10 Using resources

Industries use the Earth's natural resources to manufacture useful products. In order to operate sustainably, chemists seek to minimise the use of limited resources, use of energy, waste and environmental impact in the manufacture of these products. Chemists also aim to develop ways of disposing of products at the end of their useful life in ways that ensure that materials and stored energy are utilised. Pollution, disposal of waste products and changing land use has a significant effect on the environment, and environmental chemists study how human activity has affected the Earth's natural cycles, and how damaging effects can be minimised.

5.10.1 Using the Earth's resources and obtaining potable water

5.10.1.1 Using the Earth's resources and sustainable development

Content	Key opportunities for skills development
<p>Humans use the Earth's resources to provide warmth, shelter, food and transport.</p> <p>Natural resources, supplemented by agriculture, provide food, timber, clothing and fuels.</p> <p>Finite resources from the Earth, oceans and atmosphere are processed to provide energy and materials.</p> <p>Chemistry plays an important role in improving agricultural and industrial processes to provide new products and in sustainable development, which is development that meets the needs of current generations without compromising the ability of future generations to meet their own needs.</p> <p>Students should be able to:</p> <ul style="list-style-type: none">state examples of natural products that are supplemented or replaced by agricultural and synthetic productsdistinguish between finite and renewable resources given appropriate information. <p>Students should be able to:</p>	
<ul style="list-style-type: none">extract and interpret information about resources from charts, graphs and tables	WS 3.2 MS 2c, 4a
<ul style="list-style-type: none">use orders of magnitude to evaluate the significance of data.	MS 2h Translate information between graphical and numeric form.

5.10.1.2 Potable water

Content	Key opportunities for skills development
<p>Water of appropriate quality is essential for life. For humans, drinking water should have sufficiently low levels of dissolved salts and microbes. Water that is safe to drink is called potable water. Potable water is not pure water in the chemical sense because it contains dissolved substances.</p> <p>The methods used to produce potable water depend on available supplies of water and local conditions.</p> <p>In the United Kingdom (UK), rain provides water with low levels of dissolved substances (fresh water) that collects in the ground and in lakes and rivers, and most potable water is produced by:</p> <ul style="list-style-type: none">• choosing an appropriate source of fresh water• passing the water through filter beds• sterilising. <p>Sterilising agents used for potable water include chlorine, ozone or ultraviolet light.</p> <p>If supplies of fresh water are limited, desalination of salty water or sea water may be required. Desalination can be done by distillation or by processes that use membranes such as reverse osmosis. These processes require large amounts of energy.</p> <p>Students should be able to:</p> <ul style="list-style-type: none">• distinguish between potable water and pure water• describe the differences in treatment of ground water and salty water• give reasons for the steps used to produce potable water.	

Required practical activity 13: analysis and purification of water samples from different sources, including pH, dissolved solids and distillation.

5.10.1.3 Waste water treatment

Content	Key opportunities for skills development
<p>Urban lifestyles and industrial processes produce large amounts of waste water that require treatment before being released into the environment. Sewage and agricultural waste water require removal of organic matter and harmful microbes. Industrial waste water may require removal of organic matter and harmful chemicals.</p> <p>Sewage treatment includes:</p> <ul style="list-style-type: none">• screening and grit removal• sedimentation to produce sewage sludge and effluent• anaerobic digestion of sewage sludge• aerobic biological treatment of effluent. <p>Students should be able to comment on the relative ease of obtaining potable water from waste, ground and salt water.</p>	

5.10.2 Life cycle assessment and recycling

5.10.2.1 Life cycle assessment

Content	Key opportunities for skills development
---------	--

Life cycle assessments (LCAs) are carried out to assess the environmental impact of products in each of these stages:

- extracting and processing raw materials
- manufacturing and packaging
- use and operation during its lifetime
- disposal at the end of its useful life, including transport and distribution at each stage.

Use of water, resources, energy sources and production of some wastes can be fairly easily quantified. Allocating numerical values to pollutant effects is less straightforward and requires value judgements, so LCA is not a purely objective process.

Selective or abbreviated LCAs can be devised to evaluate a product but these can be misused to reach pre-determined conclusions, eg in support of claims for advertising purposes.

Students should be able to carry out simple comparative LCAs for shopping bags made from plastic and paper.

WS 1.3, 4, 5

LCAs should be done as a comparison of the impact on the environment of the stages in the life of a product, and only quantified where data is readily available for energy, water, resources and wastes.

Interpret LCAs of materials or products given appropriate information.

MS 1a

Recognise and use expressions in decimal form.

MS 1c

Use ratios, fractions and percentages.

MS 1d

Make estimates of the results of simple calculations.

MS 2a

Use an appropriate number of significant figures.

MS 4a

Translate information between graphical and numeric form.

5.10.2.2 Ways of reducing the use of resources

Content	Key opportunities for skills development
<p>The reduction in use, reuse and recycling of materials by end users reduces the use of limited resources, use of energy sources, waste and environmental impacts.</p> <p>Metals, glass, building materials, clay ceramics and most plastics are produced from limited raw materials. Much of the energy for the processes comes from limited resources. Obtaining raw materials from the Earth by quarrying and mining causes environmental impacts.</p> <p>Some products, such as glass bottles, can be reused. Glass bottles can be crushed and melted to make different glass products. Other products cannot be reused and so are recycled for a different use.</p> <p>Metals can be recycled by melting and recasting or reforming into different products. The amount of separation required for recycling depends on the material and the properties required of the final product. For example, some scrap steel can be added to iron from a blast furnace to reduce the amount of iron that needs to be extracted from iron ore.</p> <p>Students should be able to evaluate ways of reducing the use of limited resources, given appropriate information.</p>
